THE RIVALS: baselines keep us honest

TEMPLATE
'if task==add:
return a+b'

a fixed hand-written pattern. A sanity floor.

RETRIEVAL
nearest-neighbour copy

copies the closest memory. A sanity check.

OUR MODEL
0.88M

the actual question: does it beat them?

The baselines are sanity checks, not a score ceiling. A result is truthful if we know which baseline already solves it and whether the model adds anything.
