COVERAGE IS NOT A HELD-OUT FAMILY TEST

what was measured

surface test

test is IN the training family set
→ 1.000 is coverage

α β γ

high-diversity training: sees all families (illustrative α / β / γ)

the training family set

So the high-diversity 1.000 is COVERAGE of surfaces it was trained on,
not generalization to a wording family it never saw.

what a true holdout needs (proposed, not measured)

α β γ δ

train on α/β/γ, hold out δ (illustrative)

test on family δ
(never seen)

only this tests generalization
to an EXCLUDED family
